

SecureDoc AI

Private by design.

Document intelligence that runs entirely on your device.

The problem

- Sensitive documents (IDs, invoices, contracts, medical records) need to be read and processed.
- Most AI tools upload files to a cloud server, which exposes the data to third parties.
- Privacy-conscious users and regulated teams often cannot use them at all.

The solution

OCR

Turns scans and photos into searchable text.

Classification

Identifies the document type automatically.

Extraction

Pulls out key fields as structured data.

All three run locally. No document ever leaves the device.

Why on-device matters

- Privacy: files are never uploaded or stored remotely.
- Compliance: fits data-protection needs in legal, finance and healthcare.
- Trust: users can verify that no network calls carry document data.
- Availability: works offline, with no per-document API cost.

Who it is for

- Individuals handling personal and financial paperwork
- Small businesses and clinics with confidential records
- Teams that cannot send files to external AI services

SecureDoc AI: your documents, your device, your control.
