

SecureDoc AI: Private document intelligence

Overview

SecureDoc AI is a privacy-first document intelligence tool. It performs OCR, document classification and data extraction entirely on the user's device, so files are never uploaded to a server.

Problem

Most AI document tools send files to the cloud. For identity documents, financial records, contracts and medical papers, that exposes sensitive data and blocks adoption by privacy-conscious users and regulated organisations.

Solution

SecureDoc AI processes documents locally. It converts scans and photos to text (OCR), identifies the document type (classification) and pulls out key fields such as names, dates and amounts (extraction).

Key benefits

Private by design, with no document data leaving the device. Suited to compliance-sensitive use. Works offline with no per-document API cost.

Target users

Individuals, small businesses, clinics and teams that cannot share files with external AI services.
